1 Introduction

Background

In line with Aim 3 and 4 outlined within the Kaipara District Council Reserve Management Plan for Kai Iwi Lakes (Taharoa Domain) 2016, the Council is committed to protecting the natural environment and pristine waters within the District through imposing biosecurity controls on activities. Cook Costello have been engaged to design a boat biosecurity washdown facility at Kai Iwi Lakes to facilitate with the removal of biological contaminants (aquatic weeds, fish eggs etc.) from recreational boats and trailers.

Project description

The objective of this work is to design a practical and pragmatic washdown facility incorporating a water reclamation system with minimal operational and maintenance cost, along with overflow risk management during extreme storm events.

This design report covers the following detailed design information:

- The existing site conditions and proposed site layout
- The proposed equipment configuration
- The proposed wash water reclamation system
- The existing power supply/distribution

Site Description

The site is located adjacent to Lake Taharoa, one of the three natural freshwater lakes within the Kai lwi Lakes vicinity. The only access to the site is via Domain Road running from west to east, leading to the camping ground. The existing site aerial photograph is shown in Figure 1.

Figure 1: Site Location

The proposed wash down facility is located at the existing access entrance to the only boat launching site on Lake Taharoa. The area on the northern side of Domain Road available for facility is approximately 650m². The existing ground is covered by soil and grass (greenfield). A Scala Penetrometer test indicates well in excess of 100kPa allowable bearing strength is available. The complete Scala Penetrometer test plot is provided in Appendix A. This section of land is situated on a relatively higher, gently sloped ground with approximately 2 to 3% fall towards the west. The unpaved track on the west is the only traffic access way leading down to Lake Taharoa boat launching bay.

To the south of Domain Road is a grassed site that gently slopes west down towards a wetland catchment, as seen in Figure 1 Google Earth imagery, indicates that a small part of this grassed area is used as an informal car and boat trailer parking area.

Figure 2: Existing Wetland

Relevant documents

The following documents have been used or referenced in the preparation of this report.

Scope of the report

This report aims to develop the preliminary design of the proposed boat washdown system to provide a detailed design, including engineering drawings and indicative cost estimates.

The treatment system is required and designed to remove both the biological contaminants of concern along with suspended solids and hydrocarbons.

2 WATER RECLAMATION SYSTEM DESIGN

Washdown Facility

Figure 3: Proposed facility location. View to East. Wash pad proposed location on left of image, Get Ready and Trailer Parking on right of image. See drawing sheet C02 for the general arrangement of the boat wash area.

Design Specifications

DEMAND

Boat launching figures have not been available for this study and projections are based on anecdotal evidence that gives an estimated peak season 50 boats/day and a low season estimate of 20 boats/day. It is anticipated that the wash time per boat is 10 minutes and the proposed power wash nozzles deliver 21L/min. During periods where both power washers are in use the flow rate through the treatment system is 0.7L/s.

RAINFALL

The monthly mean rainfall depths compiled by Northland Regional Council for the Kai Iwi Lakes Road recording station have been utilised to assess the system water input gains. The monthly rainfall figures include small events that would not produce runoff. To account for this a factor of 85% has been applied to the monthly rainfall depth when calculating the runoff gain.

Water losses from the system are primarily from evaporation and wetting. Uncertainty exists in the evaporation loss figures as the only available source is the evapotranspiration potential from the NIWA Northland Climate Report. The selected values are the mean values from the Kaitaia Observatory. An element of conservatism has been incorporated by applying the losses to the

entire pad area and it has been assumed wetted for the whole day during the peak period. During the off-peak winter period it is assumed to be wetted for half of the day.

	Rainfall	Gain	Evaporation	Losses	Net
Month	mm/month	m³	mm/month	m³	m³
Jan	63	5.00	145	13.5	-8.48

Dec	76	6.02	136	12.6	-6.63

Table 1: Storage tank water balance

Between October and March, the expected mean loss from the system is 33m³, and between April and September the system has a mean gain of 38m³. The proposed minimum storage is 25m³ and it is expected this would need to be topped up once each summer. To reduce this top up frequency a storage volume totalling 50m³ would be sufficient to buffer the gains and losses and also minimise the overflow event frequency.

For initial filling and periodic top up it is proposed clean water be transported to the facility by water cart or water extracted from the closest water body of Lake Taharoa (if permitted).

PROPOSED SYSTEM

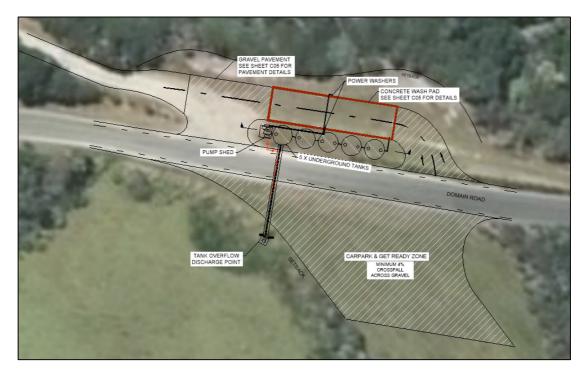

Figure 4: Proposed washdown facility - general arrangement. See sheet C02 of the drawing set in Appendix B.

The proposed wash down facility in the above figure consists of two power washers and a concrete pad, surrounded by a trafficable kerb, which allows multiple boat trailers to be washed simultaneously. Wash water is recycled through the system with gross pollutants and sediments removed prior to the water being reused. The bunded wash pad is open to the weather with rainfall in part compensating for wash water losses. Being open to the weather, the facility caters for overflow during high rainfall events.

The proposed wash pad location is on the section of land to the north of Domain Road. On the northern edge of this generally flat area the ground drops away steeply and the pad will be setback for safety to prevent fall from height and to mitigate potential slope stability issues. To allow for vehicle with trailer tracking curves the facility will be accessed from the southern side of Domain Road. This area also serves as a location for the boats to get ready prior to launching during busy periods. Vehicle sightlines have been checked on site and are sufficient subject to some minor vegetation clearance at the eastern side of the road frontage.

Wash Pad Design

The proposed wash pad is approximately 23.4m in length and 6.2m in width, with an included 5m vehicle overhang area. The bunded wash pad will be constructed with minimum slope of 2% to facilitate wash water recollection through grated field sump. The wash pad details can be found in drawing C05.

Treatment System Components and Sizing

The proposed development consists of a 145m² concrete wash pad and a series of underground storage tanks of approximately 12,500 and 25,000L in capacity.

The proposed wash pad is designed to drain the boat wash water into the field sump by gravity and subsequently into the underground treatment system as shown in drawing C03. The wash water after treatment, ultimately returned to the storage tank for reuse.

2.1.1 Field Sump

The field sump is a standard 675 x 450mm flat top cess pit and will be as per KDC standards as shown in drawing sheet C05.

LittaTrap

LittaTrap is a pre-treatment device that will be installed in the 675 x 450mm field sump in order to screen the debris, litter and gross pollutants larger than 5mm from the wash water before releasing this water into the clarifier tanks for treatment. The filter basket can be easily removed to dispose trapped debris and the frequency of cleaning shall be reviewed and determined by on-site operators.

2.1.2 Underground Tank System

The underground tank system configuration is detailed in drawing C04.

The underground water tanks have roofs that are designed for light vehicle loading (<2500kg) only. The underground tanks have been placed ensuring sufficient clearance from Domain Road pavement seal to comply with the minimum distance of 1.5m from the road, as recommended by the manufacturer to prevent any lateral loading damage to the tanks from the Domain Road traffic. The tanks have been placed at 0.6m from each other as per standard practice.

The maximum allowable cover on the proposed tank system is 300mm of topsoil as shown in drawing sheet C04. The lids are non-trafficable.

Concrete Tanks and Lids

Three 12,500 L circular concrete tanks in series are proposed as clarifiers. Following these will be two 25,000L tanks for the estimated 50m³ water storage.

All tanks will have double lids to provide access to the inlets and outlets and the spreader bars.

Spreader Bars

Spreader bars will be installed inside at the inlet and outlet of each tank to reduce short circuiting and eddying in the tank. This will slow the flow down and prevent settled sediments from getting disturbed.

Floating Outtake

The final tank in the treatment system, Tank 5 in C04, will have a 50mm floating outtake connected to the 40mm pressure pipe outlet using a reducing bush. The floating outtake ensures that the cleanest portion of the water column is pumped out for reuse, avoiding any remaining dirt that may be accumulated at the water surface.

2.1.3 Pumps and Filtration

Pump Shed

The pump shed shown in drawing C03 houses a surface mount feed pump, two super filters, two HP pumps and the necessary power connection components.

The pump housing will be 2.2 x 2.2m as suggested by the pump supplier.

The surface mount centrifugal pump is required to lift water up from the underground tank and pass it through the screen filters. Given that the pump has efficiency of at least 50%, the pump size is determined as summarised in Table 2 below.

Head Difference (m)	2.0
Pressure/Suction Head (Bar)	0.22
Allowance To Avoid Cavitation (Bar)	2
Minimum Flow Required (L/s)	0.7
Minimum Power Required (kW)	0.31
Next Available Pump Size (kW)	0.55

Table 2: Surface mount feed pump sizing

Recycled water from the underground storage will be drawn up by the 1.5kW surface mounted centrifugal pump before feeding into the inline 50µ screen filters with the flow then distributed to the spray nozzles by two 5.5kW HP pumps.

For the two HP (High Pressure) pumps, a few alternatives were recommended by Spray Pump Services. From them, the <u>140 bar, 21L/min, 5.5 kW each</u> option was chosen. The pumps will be placed on a single skid and located within a shed for security and weather proofing.

Filters

Spray Pump Services have recommended the following criteria shown in Table 3 as basic requirements for reclaimed water.

Particle Size (micron)	50
TSS (ppm)	50
рН	5 to 9

Table 3: Reclaimed water quality requirements

The two Amiad 50mm T super filters in parallel on a manifold with two 50 μ screen filters, with a screen area of 750cm² each, achieves the water quality requirements given above. The screen filters shall be cleaned, maintained or replaced regularly according to manufacturers' recommendation.

Power Supply

Power for the pump components will be harnessed by a connection from the existing underground power supply (11kV) across the road as shown in C03.

Float switch and Pump inhibiting circuit

A floating switch element and a low-level pump inhibiting circuit is suggested so that the pump stops pumping out water when the final storage tank water level, from which the reuse water is drawn out, is below 25% of the tank's total capacity. In addition, indicator lights will be installed to signal when the tank water level is at its 50% capacity and 30% capacity.

2.1.4 Possible further treatment

UV treatment of the wash water is not presently proposed. Should the biological contaminants of concern be less than 50μ this additional treatment step could be located downstream of the screen filters.

Controlled Discharge Point

The overflow from the last storage tank in the treatment train i.e. Tank 5, is piped to a controlled discharge point across Domain Road as can be seen from drawing sheet C02 in Appendix B. The sole objective of this discharge point is to allow storage tank water to overflow and prevent backflow in the treatment train following an extreme storm event.

The controlled discharge point is designed to be a manhole with a scruffy dome at the top. The overflow point details are given in C05 of the drawing set.

Operation and Maintenance

All components in the treatment system including the Littatrap, tanks, pumps and filters will follow the will follow suppliers' operation and maintenance manuals and/or guidelines. A complete set of operation and maintenance guide will be provided at commissioning.

4 LIMITATIONS

This report has been prepared for the benefit of Kaipara District Council as our client with respect to providing an engineering assessment of the proposed boat biosecurity washdown facility. It shall not be relied upon for any other purpose. The reliance by other parties on the information or opinions contained in this report shall, without our prior review and agreement in writing, be at such parties' sole risk.

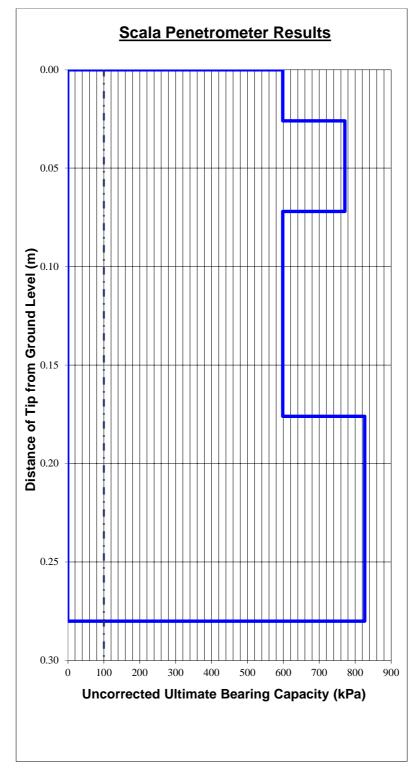

Opinions and judgments expressed herein are based on our understanding and interpretation of existing council GIS information, current regulatory standards, and should not be construed as legal opinions. Where opinions or judgments are to be relied on, they should be independently verified with appropriate legal advice.

CCL 2015 Ltd. would be pleased to provide further service to Kaipara District Council for construction coordination and believe that the project would benefit from such continuity.

CCL 2015 Ltd. have performed the services for this project in accordance with the standard agreement for consulting services and current professional standards for this assessment. No guarantees are either expressed or implied.

FOR KAIPARA DISTRICT COUNCIL, **KAI IWI LAKES BOAT BIOSECURITY** WASHDOWN, **DOMAIN RD, OMAMARI**

IMPORTANT NOTE: PRODUCER STATEMENTS

PS4 WILL NOT BE ISSUED AT COMPLETION OF WORKS UNLESS ALL REQUIRED TESTS AND CTIONS HAVE BEEN NOTIFIED TO COOK COSTELLO AND COMPLETED DURING CONST

JOB NO:14576 DATE: 24 FEBRUARY 2020

GENERAL

G1: THIS SET OF DRAWINGS IS TO BE READ IN CONJUNCTION WITH THE PROJECT SPECIFICATION AND ALL OTHER CONTRACT DRAWINGS

G2: THE DRAWINGS ARE A DIAGRAMMATIC REPRESENTATION OF THE WORK TO BE CARRIED OUT ONLY AND DIMENSIONS SHALL NOT BE OBTAINED BY SCALING

G3: ALL DISCREPANCIES SHALL BE REFERRED TO THE ENGINEER FOR DECISIONS BEFORE PROCEEDING WITH THE WORK

G4: THE CONTRACTOR IS TO CONFIRM THE LOCATION AND LEVEL OF ALL UNDERGROUND SERVICES PRIOR TO UNDERTAKING ANY EARTHWORKS OR FOUNDATION CONSTRUCTION.

G5: ALL MATERIALS AND WORKMANSHIP SHALL BE IN ACCORDANCE WITH THE CURRENT CODES OF PRACTICE EXCEPT WHERE VARIED BY THE PROJECT SPECIFICATION AND/OR DRAWINGS:

- NZS 3101:2017 CONCRETE STRUCTURES STANDARD
- NZS 3109 CONCRETE CONSTRUCTION
- NZS 3121 WATER AND AGGREGATE FOR CONCRETE
- AS/NZS 4671 STEEL REINFORCING MATERIALS

G6: GENERAL ABBREVIATIONS

- NTS NOT TO SCALE .
- UNO UNLESS NOTED OTHERWISE
- FFL FINISHED FLOOR LEVEL
- EGL EXISTING GROUND LEVEL
- FGL FINISHED GROUND LEVEL

G7: WHERE PROPRIETARY PRODUCTS ARE SPECIFIED IN THE DOCUMENTS THE CONTRACTOR MAY SUBMIT AN ALTERNATIVE PRODUCT FOR APPROVAL AND SUBJECT TO KAIPARA DISTRICT COUNCIL APPROVAL

G8: ALL WORKS ARE TO COMPLY WITH THE HEALTH & SAFETY AT WORK ACT 2015.

G9: ALL WORKS SHALL BE PREFORMED IN ACCORDANCE WITH THE APPROVED ENGINEERING PLANS. PROJECT SPECIFICATION AND ALL OTHER CONTRACT DRAWINGS AND TO BE SUBJECT TO THE KDC ES. 2011 AND USED IN CONJUNCTION WITH NZS4404:2010

G10: KDC STANDARD DETAILS HAVE NOT BEEN INDEPENDENTLY VERIFIED BY COOK COSTELLO. WE HAVE ACCEPTED THAT THEY WILL PERFORM FOR THE REQUIRED LIFE EXPECTANCY AS STATED IN THE KDC ES, 2011. WE ACCEPT NO LIABILITY IF THE STANDARD DETAILS DO NOT ACHIEVE THIS DESIGN LIFE.

G11: ALL LEVELS & CONNECTION POINTS TO BE CHECKED & CONFIRMED ON SITE PRIOR TO CONSTRUCTION. ATTENTION TO LEVELS IS OF CRITICAL IMPORTANCE TO THIS DESIGN.

G12: EROSION CONTROL - ALL SILT CONTROL MEASURES SHALL BE PLACED PRIOR TO COMMENCEMENT OF EARTHWORKS. SUCH MEASURES SHALL BE SUBJECT TO FURTHER ADDITIONS AND ALTERATIONS, WHERE CONSIDERED NECESSARY, AS DIRECTED BY THE PROJECT MANAGER OR COUNCIL. DURING THE PROGRESSION OF WORKS. IT IS ADVISED TO CONTACT NRC PRIOR TO COMMENCEMENT OF EARTHWORKS. AFTER INSTALLATION OF EROSION AND SEDIMENT CONTROL DEVICES TO ENSURE THEY HAVE BEEN INSTALLED TO THE SATISFACTION OF NRC.

CONCRETE

C1: ALL MATERIALS AND WORKMANSHIP SHALL BE IN ACCORDANCE WITH NZS3109 AND NZS3101 SUBJECT TO RELEVANT SECTIONS OF THE SPECIFICATION

C2: NO CONCRETE SHALL BE PLACED UNTIL THE DESIGNER HAS HAD THE OPPORTUNITY TO OBSERVE THAT THE DRAWINGS AND SPECIFICATIONS HAVE BEEN COMPLIED WITH

C3: ALL CONCRETE SUPPLY AND PRODUCTION SHALL BE IN ACCORDANCE WITH NZS 3104, 3101:2017.

C4: WHERE THE LOCATION OF CONSTRUCTION JOINTS IS NOT SPECIFICALLY DETAILED ON THE STRUCTURAL DRAWINGS, CONSTRUCTION JOINTS SHALL BE COORDINATED WITH THE ENGINEER AS REQUIRED. THE CONSTRUCTOR SHALL ALLOW FOR ALL SUCH CONSTRUCTION JOINTS.

CONCRETE PAVEMENTS

CP1: UPON EXPOSURE OF SUBGRADE AT PAVEMENT BASE CONTACT ENGINEER FOR INSPECTION AND INSTRUCTION TO REMOVE AND REPLACE ANY SOFT AREAS PRIOR TO COMMENCING CONSTRUCTION OF PAVEMENT LAYERS. EXCAVATED MATERIAL TO BE REMOVED FROM SITE

CP2: SUPPLY AND COMPACT BASECOURSE LAYER IN ACCORDANCE WITH CROSS SECTIONS SUPPLIED.

CP3: CONCRETE USED SHALL BE SPECIAL GRADE WITH 28 DAY COMPRESSIVE STRENGTH OF 30MPA.

CP4: ALL CONCRETE SHALL BE CURED BY AN APPROVED METHOD FOR AT LEAST 7 DAYS AFTER POURING. CURING METHOD SHALL BE PROPOSED TO ENGINEER FOR APPROVAL. SOME PROPRIETARY SURFACE TREATMENTS MAY NOT BE APPROVED.

EARTHWORKS

E1: ALL SITE EARTHWORKS ARE TO BE CARRIED OUT IN ACCORDANCE WITH THE REQUIREMENTS OF NZS4431, SOIL BEARING CAPACITY IS TO BE VERIFIED UPON COMPLETION OF SITE EARTHWORKS AND DURING FOUNDATION EXCAVATION TO ENSURE ACTUAL SITE CONDITIONS ARE COMPATIBLE WITH THE INFERRED GEOTECHNICAL MODEL. OVER EXCAVATION AND BACKFILLING WITH ENGINEERED FILL OR SITE CONCRETE MAY BE NECESSARY WHERE SOFT SOIL / FILL IS ENCOUNTERED WITH PRIOR VARIATION APPROVAL

E2: COMPACTION IN BASE OF PIPE TRENCHES TO ACHIEVE CLEGG 10.

STORMWATER DRAINAGE

SW1: ALL WORK AND MATERIALS SHALL COMPLY WITH THE PROJECT DRAWINGS AND SPECIFICATIONS AND CURRENT KDC STANDARDS AND SPECIFICATIONS. ANY CONFLICT BETWEEN THE PROJECT DOCUMENTS AND COUNCIL STANDARDS SHALL BE RAISED WITH THE ENGINEER FOR RESOLUTION, PRIOR TO CONSTRUCTION.

SW2: ALL TRENCH EXCAVATION SHALL COMPLY WITH ALL WORKPLACE HEALTH AND SAFETY REQUIREMENTS.

SW3: THE CONTRACTOR IS RESPONSIBLE FOR THE DESIGN, CERTIFICATION. APPROVAL AND CONSTRUCTION OF ALL TEMPORARY WORKS INCLUDING BOTH STRUCTURAL ENGINEERING AND GROUNDWATER CONTROL. SUITABLY QUALIFIED PROFESSIONALS CARRYING ACCEPTABLE LEVELS OF PROFESSIONAL INDEMNITY INSURANCE SHALL BE PROPOSED TO THE ENGINEER BEFORE WORK COMMENCEMENT AND THE USE OF ANY PERSONS UNDERTAKING THIS TYPE OF WORK SHALL BE SUBJECT TO APPROVAL BY THE ENGINEER.

SW4: FOR PIPE BEDDING, SURROUND AND BACKFILL DETAILS REFER TO PIPE BEDDING DETAILS.

SW5: WHERE PIPES ARE LAID IN FILL THE FILL SHALL BE PLACED TO FINAL SURFACE LEVELS BEFORE TRENCHING IS COMMENCED. THE FILL SHALL BE PLACED IN LAYERS NOT EXCEEDING 200MM LOOSE THICKNESS AND COMPACTED IN ACCORDANCE WITH THE REQUIREMENTS FOR EARTHWORKS (IF REQUIRED), A CERTIFICATE PROVIDED BY THE CONTRACTOR'S INDEPENDENT TESTING AGENCY CONFIRMING THE FILL MEETS THE SPECIFIED COMPACTION STANDARDS SHALL BE PROVIDED BEFORE ANY PIPE LAID IN NEW FILL WILL BE APPROVED BY THE ENGINEER OR ACCEPTED BY THE CONTROLLING AUTHORITY.

INSPECTIONS / SITE VISITS REQUIRED

11: PRE-CONSTRUCTION SITE MEETING WITH CONTRACTOR. ENGINEER AND KDC PRESENT. NRC TO BE INFORMED OF WORKS ON SITE PRIOR TO COMMENCING WORKS.

12: STRIPPED GROUND INSPECTIONS OF CROSSING, PAD, TANK SUBGRADE AND SITE FILL AREAS.

13: CONTROLLED FILL TESTING TO BRING FILL UP TO SUBGRADE LEVELS TO BE CONSTRUCTED IN 200mm MAX LIFTS AND TESTED EVERY 600mm

14: SUBBASE PAVEMENT TESTING FOR ROAD IN ACCORDANCE WITH PAVEMENT DETAILS. CONTRACTOR TO ALSO PROVE SUBBASE METAL DEPTHS WITH STRING LINES

15: BASECOURSE PAVEMENT TESTING FOR ROAD AND CROSSINGS IN ACCORDANCE WITH PAVEMENT DETAILS. CONTRACTOR TO ALSO PROVE BASECOURSE METAL DEPTHS WITH STRING LINES.

I6: STORMWATER TRENCH COMPACTION TEST

17: REINFORCED CONCRETE WASHPAD - PREPOUR CONCRETE INSPECTION FOR CHECKING OF CROSSING DIMENSIONS AND REINFORCING PLACEMENT WITH ENGINEER AND KDC PRESENT.

18: FINAL INSPECTION WITH KDC ENGINEER AND CONTRACTOR TO ENSURE ALL WORKS HAVE BEEN CONSTRUCTED IN ACCORDANCE WITH THE APPROVED ENGINEERING PLANS FOR FINAL SIGNOFF.

Compacted Basecourse layer' *PAP 40 TNZ M/4 - Roads

Approved compacted granular Bedding Material or compacted GAP 20 bedding (if specified).

*GAP 40 - Entrances (mechanically compacted in

150mm layers) GAP 65 mechanically compacted in 150mm layers (Use detector lape as below)

- 10. Pipelines at 1:3 gradient or steeper shall have 'weak mix' concrete bedding (10MPa). Large pipes will require Specific pipe design.
- 11. Concrete bedding shall be allowed to cure for 48 hours prior to backfilling.
- 12. Backfilling under carriageways may be with 'flowable fill' (low strength fly-ash concrete).
- 13. Granular bedding is to satisfy N.Z.S 7643 Appendix B.
- 14. Minimum cover over pipes (unless specifically designed or protected in accordance with KDC S26), to the highest point or bell, of the outside of the pipe (or collar) in any area shall be ; a) 300mm - if not subjected to traffic loading
 - b) Ref. to above charts under carriageways and trafficked areas.
